

Henry® Restoration System (HRS) featuring silicone – a cost-effective alternative to re-roofing

EL SEGUNDO, Calif., April 3, 2015 – A Henry® Restoration System (HRS) – featuring Pro-Grade® Elite silicone coatings – provides durable, weatherproofing protection on flat roofs, barrel roofs or low-sloped roofs. The silicone roof restoration system from Henry is easy to apply and features a self-flashing, silicone membrane material that provides a seamless, long-lasting, low-maintenance solution.

“The Henry Restoration System benefits all those involved – reducing application time for the contractor and delivering years of durable and sustainable protection for the building owner,” said Ed Buczek, product manager, Henry Company. “Additionally, the system is good for the environment, as it helps to reduce landfill waste by restoring – not replacing – a roof.”

Henry’s silicone roof restoration system – featuring Pro-Grade® Elite silicone coatings and sealants – complies with cool roof reflectivity and environmental requirements, enabling energy savings due to lower internal building temperatures and improved effectiveness of HVAC units. Additionally, the complete line of Pro-Grade® Elite silicone coatings and sealants offers adhesion properties that help minimize the need for adhesion primer coats. A fast cure time (approximately 1 hour) eliminates the threat of wash offs between rainy days, and the ability to use in cooler and hotter temperatures provides an increased application window.

The complete line of Pro-Grade® Elite silicone coatings and sealants consists of 988HS Silicone Roof Coating (available in white and gray), 600 Butter Grade Silicone Roof Sealer, 700 Silicone Roof Sealant, 750 Pitch Pocket and Self Leveling Sealer, and 211 Primer.
